Abstract: Objective To explore the correlation between serum lipids, creatine kinase (CK) and lactate dehydrogenase (LDH) and the course of disease in patients with depression. **Methods** 154 cases of first-episode depressive patients were selected from January 2015 to August 2017, as the research group, and 150 cases of healthy volunteers in the same period as the control group. Serum lipids, CK and LDH were measured in all subjects. The correlation between serum lipids, CK, LDH and the course of depression was analyzed statistically. **Results** Compared with the control group, the levels of TG in each depression group were significantly higher. The levels of TG in mild depression group, moderate depression group and severe depression group were increased in turn. The differences were statistically significant ($P<0.05$). The levels of TC, CK and LDH in each depression group were significantly lower than that in the control group. The levels of TC, CK and LDH in mild depression group, moderate depression group and severe depression group were decreased in turn. The differences were statistically significant ($P<0.05$). Compared with the control group, TG, TC, CK and LDH levels of statistical variance in the other groups were $F=15.38\sim77.2$, $P<0.01$, while HDL-C and LDL-C levels of statistical variance were $F=0.27\sim0.43$, $P>0.05$. TG, TC, CK and LDH levels were independent risk factors for depression. **Conclusion** The levels of serum lipids, CK and LDH in depressive patients would change and were related to the course of depression. Detection of serum lipids, CK and LDH levels in patients with depression is so helpful to understand the degree and development of depression that can provide an important basis for the detection and intervention of clinical depression.

抑郁症具有反复发作、高致残率和高死亡率的特点,给患者和家属带来巨大的痛苦,同时也带来一系列的社会问题^[1~3]。目前对于抑郁症的发病机制仍不明确,普遍认为抑郁症的发生与神经递质紊乱、神经内分泌功能紊乱、免疫功能紊乱、遗传因素等多方面有关^[4]。本研究为了研究抑郁症与神

经内分泌方面的相关性,具体对抑郁症患者的血脂水平和肌酸激酶(CK)、乳酸脱氢酶(LDH)等血清酶进行研究,分析其与抑郁症患者病情程度的相关性。现将研究结果报告如下。

为进一步研究血脂、CK、LDH水平与抑郁症病程的相关性,现以抑郁症病程为因变量,以TG、TC、HDL-C、LDL-C、CK和LDH为自变量,经

Logistic回归分析,α取0.05,经校正后TG、TC、CK和LDH均入组抑郁症危险因素模型。

3 讨论 抑郁症是影响人类健康的一大疾患,主要表现为思维迟缓、情绪低落、意志活动减弱^[5]。目前对于抑郁症患者血脂水平的研究有不同的看法,有研究^[6]认为抑郁症患者心情郁结、食欲减弱、体重减轻而导致胆固醇等血脂水平下降;也有研究^[7,8]认为是TC水平降低,体内TC、LDL-C水平下降,减弱了脑细胞膜的流动性和脂质的微黏性,造成5-羟色胺受体数量减少、功能减弱从而导致抑郁症发生。本研究发现,抑郁症组TG水平显著高于对照组,且轻度抑郁症组、中度抑郁症组及重度抑郁症组的TG水平依次增高,差异均有统计学意

义($P<0.05$),提示抑郁症患者TG水平升高,且随着病程加重而增高;而抑郁症组TC水平显著低于对照组,轻度抑郁症组、中度抑郁症组及重度抑郁症组的TC水平依次降低,差异均有统计学意义($P<0.05$),提示抑郁症患者TC水平降低,且随着病程加重而下降。研究证明了抑郁症患者存在脂代谢紊乱,研究结果与相关研究^[9]相符。血脂水平的变化与抑郁症的发生发展密切相关,其对抑郁症程度的影响是多途径的、多种机制共同作用的^[10],其中血脂起关键作用的主要有以下方面:首先,资料显示^[11]抑郁症患者TC和5-羟色胺水平相比正常人低,当抑郁症患者服用SSRI类药物后,其血脂水平明显升高,证明抑郁症患者血脂水平与5-羟色胺相关,而5-羟色胺再摄取减少是引起抑郁症的主要原因^[12]。其次,抑郁症患者下丘脑-垂体-肾上腺素轴功能亢进,导致其内分泌功能紊乱,抑郁症患者唾液内皮质醇含量升高,因此其血脂水平比正常人群要高^[13]。当抑郁症患者TG水平升高时,在下丘脑-垂体-肾上腺素轴作用下,胰岛素抵抗增加,胰岛素功能减弱,从而使血糖水平升高。

本研究对抑郁症患者血清CK,LDH水平进行检测对比,发现各抑郁症组CK,LDH水平均显著降低,轻度抑郁症组、中度抑郁症组及重度抑郁症组的CK,LDH水平分别依次降低,差异具有统计学意义($P<0.05$)。有报道,CK活性可以反映交感神经系统活动情况^[14],而抑郁症患者思维迟缓、情绪低落,交感神经系统活动减弱,导致血清CK水平降低。同时抑郁症患者去甲肾上腺素水平降低、多巴胺-β羟化酶活性降低,导致腺苷酸环化酶水平降低,从而降低了血清CK,LDH水平。

本研究为进一步研究血脂、CK,LDH水平与抑郁症病程的相关性,以抑郁症病程为因变量,以TG,TC,HDL-C,LDL-C,CK和LDH为自变量,进行Logistic回归分析,α取0.05,经校正后TG,TC,CK,LDH均入组抑郁症危险因素模型。

综上所述,抑郁症患者血清血脂、CK,LDH水平存在异常,且各指标水平改变与抑郁症病程相关,提示了抑郁症患者体内存在多系统功能改变。检测抑郁症患者血清血脂、CK,LDH水平有助于了解抑郁症病情程度和发展情况,为临床抑郁症的检测与干预治疗提供重要依据。本研究仅比较了抑郁症患者和正常对照组的血脂和CK,LDH水平,探讨其对抑郁症病情的相关性,而对于此类血清学指标在其他精神疾病中的应用以及其他相关脂质和血清酶成分变化是否与抑郁症发生发展相

关等均需要进一步研究。
